The “C1” option is the dry relay contact (DRC) option with wires for each contact that extend outside the SPD enclosure through the conduit fitting and offers both normally open (NO) and normally closed (NC) contacts. These contacts do not share a common terminal; therefore, they can both be used, or they can be used independent of one another. Also, the contacts are truly form “C” contacts (independent NO and NC contacts). The contacts change state when either the internal or external over-current device opens or when power is lost to the suppressor. This feature can be used in combination with existing monitoring systems. There is no voltage supplied to the contacts; thus, the terminology “dry” or “volt-free”.
